Amac Aerospace Switzerland has returned to service a privately owned Boeing 737-800 after a heavy base maintenance check. The project, which was completed at Amac's Basel facility for an undisclosed private owner, also involved various cabin modifications. Most notable was the installation of a tail-mounted external camera and the installation of new cabin monitors.

The company replaced HD monitors with 4K cabin monitors and installed a 4K-capable flight information system, and believes it is the first completion center to install 4K cabin monitors in an aircraft. All modifications were performed during the scheduled maintenance period without incurring additional ground time, meeting the customer's operational requirements and costs.

Amac also operates a maintenance facility at Istanbul in Turkey.
